Abstract: Medicinal plants constitute an effective source of traditional and modern medicine. In India, about 80% of the rural population depends on medicinal herbs and/or indigenous system of medicine. Adulterants and substitutes are the common malpractices in herbal raw material trade. Adulteration is considered as an intentional addition of foreign substances to increase the weight or potency of the product or to decrease its cost. It may be due to- Confusion in vernacular names, Lack of knowledge about authentic plants, Non availability, Similarity in morphology, activity, aroma. Careless collection and other unknown reasons. Many Substitute Drugs are mentioned in Ayurvedic texts. The principles to select substitute drugs based on similarity of properties (Rasa, Guna Virya and Vipaka) but most important factor is therapeutic action (Karma). In present era number of species in endangered plant list is increasing very fast. In this scenario selection of substitute drugs may be the right option.

Keywords: Ayurveda, Adulteration, Substitute drug.

Introduction: Ayurveda is a system of Indian traditional form of alternative medicine. Adulteration and Substitution are frequent in raw material trade of medicinal plants. Herbal adulteration is one of the common malpractices in herbal raw material trade. At present the adulteration and substitution of the herbal drugs is the burning problem in herbal industry. The deforestation and extinction of many species and incorrect identification of many plants has resulted in adulteration and substitution of raw drugs [1,2]. The term adulteration of an article covers a numbers of condition which may be intentional or accidental. It is a practice of adding foreign substance in place of original crude drug partially or fully which is inferior or substandard in therapeutic and chemical proper ties or addition of low grade or spoiled drugs or entirely different drug similar to that of original drug adding which an intention of enhancement of profits [3,4]. Due to adulteration, faith in herbal drugs has declined. Adulteration in market samples is one of the greatest drawbacks in promotion of herbal products. In adulterated drugs, it is invariably found that the Adverse Event Reports are not due to the intended herb, but rather due to the presence of an unintended herb [6,7,8]. Medicinal plant dealers have discovered the scientific methods in creating adulteration of such a high quality that without microscopic and chemical analysis, it is very difficult to trace these adulterations, [9,10,11,12]

Many Substitute Drugs are mentioned in Ayurvedic texts. The principles to select substitute drugs based on similarity of properties (Rasa, Guna Virya and Vipaka) but most important factor is therapeutic action (Karma). In terms of pharmacy, substitute is generally done when original drugs are not available or may be available in small quantity. In ancient time, Vaidya had to collect the drug by own self. The drugs which were less available in local area were replaced by the another drugs known as Substitute drugs (Pratinidhi Dravyas). The prior Acharyas like Charaka and Sushruta have not give direct reference or listing of Substitute drugs but, Acharya Vagbhata have stated that in case of nonavailability of any particular drug in the preparation of compound one should try to get another similarly potent drug having similar
Rasa(Test), Guna(Property), Virya(Potency) and Vipaka. Detail description regarding Substitute drugs can be traced from the text books like Bhavaprakasha (Author Bhavnishra in 16th century), Yogaratnakara (Author Unknown in 17th century) and Bhaishajya ratnavali (Author Govind das in 14th century) mentioned.\textsuperscript{13,14,15,16}

Materials and Methods

Available Ayurvedic Literatures were studied for better understanding of concept of Adulteration and Substitutes drugs. Information regarding adulterated drugs and Substitutes drugs from various journals, Ayurvedic texts and also Internet media was also used for availability and necessity for comprehensive understanding of the subject. A detail list of classical drugs and their Substitutes drugs with their botanical names was prepared, which was critically studied.

A. Methods of Adulterating the Drugs:
Adulteration in simple term is debasement of an article. Drugs are generally adulterated or substituted with substandard, inferior or artificial drugs.

A.1 Adulteration with Substandard Commercial Varieties: Adulterants resemble the original crude drug morphologically, chemically, therapeutically but are substandard in nature and cheaper in cost. This is the most common type of adulteration. Example is Nux vomica seed (strychnos nux-vomica) are adulterated with Strychnos nux-blanda or Strychnos potatorum seed.

A.2 Adulteration with Superficially Similar but Inferior Drugs: Inferior drugs may or may not have any chemical or therapeutic value. They resemble only morphologically, so due to its resemblance they are used as adulterants. Common example is adulteration of cloves by mother cloves. Saffron with dried flowers of Carthamus tinctoria (Safflower).

A.3 Adulteration with Artificially Manufactured Substance: This type of adulteration is observed in case of drugs which are costly. Examples - Paraffin wax is tinged yellow and adulterated with yellow bees wax, while artificial invert sugar is mixed with honey.

A.4 Replacement by Exhausted Drugs: The same drug is admixed but that drug is devoid of medicinally active substance as it has been extracted already. Mainly volatile oil containing drugs like clove, coriander, fennel are adulterated by this method. As it is devoid of colour and taste due to extraction, natural colour and taste is manipulated with additives.

A.5 Harmful Adulterants: Some are harmful materials as the adulterant, are collected from market waste materials and admixed with the drug. It is done for the liquid drugs.

A.6 Adulteration of Powders: The drugs which are in the form of powders are frequently adulterated. Examples: dextrin is added in ipecacuanha, red sandel wood in capsicum powder and powdered bark adulterated with brick powder.\textsuperscript{17,18}

B. Reason of Adulteration

B.1 Confusion in Vernacular Names: In Ayurveda, Parpatta refers to Fumaria parviflora. In Siddha, ‘Parpadagam’ refers to Mollugo pentaphylla. Owing to the similarity in the names in traditional systems of medicine, these two herbs are often interchanged or adulterated. Because of the popularity of Siddha medicine in some parts of South India, traders in these regions supply Mollugo pentaphylla as Parpatta/Parpadagam and the North Indian suppliers supply F. parviflora. These two can be easily identified by the presence of pale yellow to mild brown colored, thin wiry stems and small simple leaves of Mollugo pentaphylla and black to dark brown colored, digitate leaves with narrow segments of F. parviflora. Casuarina equisetifolia for Tamarix indica and Aerva lanata for Berginia ciliate are some other example for adulterations due to confusion in names.

B.2 Lack of Knowledge About Authentic Source: Nagakesar is one of the important drugs in Ayurveda. The authentic source is Mesua ferrea. However, market samples are adulterated with flowers of Calophyllum inophyllum. Though the authentic plant is available in plenty throughout the Western Ghats and parts of Himalayas, suppliers are unaware of it. There may also be some restrictions in forest collection. Due to these reasons, C. inophyllum (which is in the plains) is sold as Nagakesar. Authentic flowers can be easily identified by the presence of two-celled ovary whereas in case of spurious flowers they are single celled.

B.3 Similarity in Morphology: Mucuna pruriens is adulterated with other similar Papilionaceae seeds having similarity in morphology. M. utilis (sold as white variety) and M. deeringiana (sold as bigger variety) are popular adulterants. Apart from this M. cochinchinensis, Canavalia virosa and Censiformis are also sold in Indian markets. Authentic seeds are up to 1 cm in length with shining mosaic pattern of black and brown color.
on their surface. *M. deeringiana* and *M. utilis* are bigger (1.5-2 cm) in size. While *M. deeringiana* is dull black and *M. utilis* is white or buff colored.

B.4 Similarity in Color: It is well known that with course of time, drug materials get changed to or substituted with other plant species. ‘Ratanjot’ is a recent day example. According to the suppliers and non-time forest product (NTFP) contractors, in the past, roots of *Ventilago madraspatana* were collected from Western Ghats, as the only source of ‘Ratanjot’. However, that has not been practiced now. It is clearly known that *Arnebia euchroma* var.euchroma is the present source. Similarity is in yielding a red dye, *A. euchroma* substitutes *V. madraspatana*. Recently *V. madraspatana* is not found in market. Whatever is available in the market, in the name of Ratanjot is originated from *A. euchroma*.

B.5 Careless Collections: Some of the herbal adulterations are due to the carelessness of herbal collectors and suppliers *Parmelia perlata* is used in *Ayurveda*, Unani and Siddha. It is also used as grocery. Market samples showed it to be admixed with other species (*P. perforata* and *P. cirrhata*). Sometimes, *Usnea* sp. is also mixed with them. Authentic plants can be identified by their thallus nature.

B.6 Other Unknown Reasons: *Vidari* is another example of unknown authentic plant. Its authentic source is *Pueraria tuberosa* and its substitute is *Ipomoea digitata*. However, market samples are not derived from these two. It is interesting to know that an endangered gymnosperm *Cycas circinalis* is sold in plenty as *Vidari*. The adulterated materials originated from Kerela, India. Although both the authentic plant and its substitute are available in plenty throughout India, now *Cycas circinalis* became a major source for this drug is unknown19,20.

C. Types of Substitution

C.1 Using Totally Different Drug: *Bharangi* (*Clerodendron indicum*) and *Kantakari*. *Bharangi* has tikta rasa and Laghu, ruksha guna and has Kapha and vatahara property. While *Kantakari* (*Solanum xanthocarpam*) has katu vipaka and ushna virya. It has Glycosides–Verbasconside and Solasoninie, solamargin, solasurine respectively. Both *C. indicum* and *S. xanthocarpam* have shown Anti-hisaminic activity. Both *C. indicum* and *S. xanthocarpam* are commonly employed in the diseases related to the respiratory system, which are commonly associated with release of Histamines and other Autacoids.

C.2 Substitution of the Species Belonging to Same Family: The *Datura metal* and *Datura stramonium* can be considered here. Chemical Constituents are Alkaloids, Scopolamine, Atropin, Hyocynam, Lysocine. The Alkaloids are proved as Bronchodilator and inhibitor of secretion of mucous membrane. The alcoholic extract of *D. metal* show Anti helmentic Activity The Alkaloid present in Both the species are well proven Bronchodilators and also they inhibit the secretion of Mucous membrane of the Respiratory tract. Thus as far as the diseases of the Respiratory tract are concerned both *D. metal* and *D. stramonium* are beneficial, while as Krimihara *D. metal* would be a better choice as it is a proven Anthelmintic.

C.3 Substitution of Different Species: Two types of *Gokshura*. *Tribulus terrestris* (zygophylacae) and *Pedalium murex* (Pedaliaceae). *T. terrestris* has the chemical constituents like Chlorogenin, Diosgenin, Rutin, Rhamnose, and Alkaloid. While *P. murex* has Sitosterol, Ursolic acid, Vanillin, Flavonoids and Alkaloids. Both the species are proved for Nephroprotective, Lothotriptic, Diuretic and Hepatoprotective activities. If we analyse the clinical conditions where Gokshura is indicated i.e- mutrakrrcha, Mutraghata, Ashmari, Prameha etc, both *T. terrestris* and *P. murex* appear to be appropriate.

C.4 Substitution of Different Parts of the Same Plant: The root of *Sida cordifolia* and the whole plant of *Sida cordifolia* can be considered. Root has the chemical constituents such as Sitoindoside, Acyclstergyloside. While the whole plant has Alkaloid, Hydrocarbons, Fatty acids, Ephedrine. Various extracts of the whole plant showed Anti-bacterial, Anti-oxidant, Hypoglycemic, Hepatoprotective and Cardio tonic activities. Though it is the root which is mentioned as officinal part of *S. cordifolia* in the classics as Balya, Brumhana,Shotahara etc,modern researches proves that even the aerial parts are also equally effective

C.5 Due to Same in Action: *Embelica officinalis* shows antioxidant, hepatoprotective, antimicrobial, hypoglycemic and hypolipidemic action. *Semecarpus* shows anti-tumour, hypotensive, anticytotoxic and anticancerous properties etc. Both Amalaki and Bhallataka are Rasayana (rejuvenator) drugs. In current practice the Rasayana formulations are being employed as an adjuvant therapy in Chronic as well as
Malignant diseases. Amalaki can be employed as Rasayana in Chronic debilitating diseases like bronchial asthma, diabetes etc, while Bhallataka would be better choice in malignant conditions, both in solid tumors and in leukemia.

D. Reasons for Substitution

D.1 Non-availability of the Drug: In case of nonavailability of leaf of the Abies webiana (Talispatra) leaf of the Abies baccata are used.

D.2 Uncertain Identity of the Drug: For the herb Lakshman different species such as Aralia quinquefolia, Ipomea sepiaria etc are considered.

D.3 Cost of the Drug: Kumkuma being costly herb is substituted by Kusumba Geographical distribution of the drug: Rasna (Pluchea lanceolata) is used in Northern India while in southeren parts Alpinia galanga is considered as the source.

D.4 The Adverse Reaction of the Drug: Vasa is a well known Rakta-Pittahara (cures bleeding disorder) drug, but due to its abortifacient activity its utility in pregnant women is limited, instead drugs such as Laksha, Ashoka etc are substituted.

D.5 Seasonal Availability of Drugs: some drugs are available in spacific season so other drugs can be introduced, which have same action. For example: Trianthema portulacastrum can be used in seasonal absences of Boerhavia diffusa.

D.6 Shelf Life of the Drug: In case of non availability of old jaggery used new jaggery after heating in sun rays for 4 hr. [21,22,23,24]

**Discussion:** Adulterants and substitutes are different. The most essential criteria for substitution is the Pharmacological activity rather than Morphology or Phytoconstituents. Substitute is rational replacement of herbal drugs to get similar medicinal properties from replaced material, so substitute and Adulteration can be understood in two ways : legally (official substitutes) and Illegally (commercial aspect) The legal substitute of the drug is scientifically proved. It means that the drug has the properties which are similar to the original one. Illegal means the drug has been using instead of the original one is not scientifically proved but it is commercially beneficial to the adulterator or drug dealer.

**Conclusion:** Substitution of the herbs is the need of the hour with more than 300 medicinal plants becoming red listed. It provided greater scope for the physician to utilize herbs that are easily available, cost effective and most appropriate for the clinical condition. It is not that all adulterations are intentional malpractice as stated in many literatures. With our experience it is noted that the herbal drugs are adulterated unintentionally also. Suppliers are illiterate and not aware about their spurious supply. Nowadays, Ayurvedic drug industries follow high quality standards using modern techniques and instruments to maintain their quality. World Health Organization (WHO), in its publication on quality standards for medicinal plant
materials, recommends rejecting any batch of raw material, which has more than 5% of any other plant part of the same plant (e.g. stem in leaf drugs), never the less if they are derived from the authentic plant. Based on these standards, adulteration whether, intentional or unintentional, should be rejected. Also, suppliers and traders should be educated about the authentic sources [27,28].
